

Warehouse Management

All ins and outs under control. From inventory to processes.

To fulfill your customers' expectation of lower costs and shorter lead times, you need to be ready. By automating your warehouse processes with 3PL Dynamics software, you sharpen the focus on costs, efficiency, quality, and reliability while facilitating your administrative burden.

Specifically for logistics service providers active in handling and storage, we have developed a WMS system. From a simple inbound order to RF scanning, Cross Docking, Customs Brokers and EDI: it's all available in 3PL Dynamics. Unlike other WMS systems goods are linked to customers in our WMS: multiple customers in a single warehouse is standard in our software. And with just one mouse click all value added logistics activities are registered and invoiced.

Support your entire warehousing activities

With WMS module you have all the basic functionalities of a modern WMS at your fingertips. The WMS offers all functionalities for a public warehouse:

- **Order picking:** Whether you work with wireless barcode scanners, voice terminals or mechanization – our WMS is equipped for all order picking activities of logistics service providers.
- **RF-Scanning:** With the module RF scanning all warehouse operations are controlled via scanners. Real-time insight: which ensures grip and control of logistics processes.
- **Customs:** Through a direct link between our WMS software and customs systems, declaration of your customers' goods can be done easily and automated.
- **Value Added Logistics:** All VAL activities are planned and administered in the WMS, fully integrated into the scanning process. Invoicing of VAL activities is simple with the push of a button.
- **Weight integration:** Register the correct weights in the WMS system via standard interfaces with scales and weighbridges via scanners or touch screens.
- **Cross docking:** Convert incoming goods directly to outgoing goods and place the goods by using the scanning process in the right location for cross-dock storage.
- **Quality control:** Linking wireless terminals or tablets to the WMS system allows you to check the quality of goods in every phase of the logistics process. The results of the quality check are connected to the respective goods, products, lots or batches in the WMS system.

- **Tracking & tracing:** Any movement of goods, lots, batches, pallets or boxes in the warehouse is registered and becomes transparent with just one mouse click.
- **Label printing:** Design SSCC labels like your customers want them. You can define and print labels by product, customer and delivery address.
- **Customer portal:** Give your customers access to their own web portal to check information about orders, invoices, goods-in and goods-out (on product/batch level) and changes in inventories.
- **EDI:** Through our connectors, we offer several standard interfaces out-of-the-box.

WMS & invoicing

The WMS seamlessly integrates with the financial administration in Dynamics 365 Business Central, meaning all warehouse activities per customer are registered and invoiced for promptly and easily. This provides you with real-time insight into your financial situation, including pending invoices.

Management information in WMS

To measure is to know. That is why our total solution for logistics suppliers covers all necessary report formats. From a simple stock list up to a complete dashboard with your most important KPIs. Because all data is available within one integrated solution, you gain a clear insight into all your business processes which enables you to manage rather than fight fires.

The advantages at a glance

- Fully traceable goods
- Actual, trustworthy shipment information
- Considerable error reduction
- Efficient business management
- Lower costs
- Higher service towards customers
- High deliver reliability

Based on the knowledge and experience of other logistics service providers that are trying to reinvent the wheel on their own, we have partnered with a reputable Dutch company Boltrics to bring to market, their standard 3PL Dynamics solutions offerings for the logistics industry. As a modern, internationally operating and certified ERP and CRM partner, we can help you simplify, automate and streamline your internal processes, easily guide you through the implementation of appropriate products to be applied to the latest trends in modern application technology, and help you with digital transformation and cloud-based solutions. For 30 years, we have been helping to improve our customers' business results in the Czech and Slovak Republics, as well as with customers in many countries in Europe, South Africa and the USA.
